

According to Friends of the Earth over a quarter of all the CO<sub>2</sub> produced in the UK is the result of transport.

Increasingly, when people are booking holidays, they ask travel agents about ecological aspects of their planned trip.

How much carbon dioxide (CO<sub>2</sub>) would the travel for each of these holidays produce?

- A beach holiday in San Tropez in the south of France, travelling by car.
- A visit to Disney World, flying to Orlando in Florida, United States.
- A week on the Greek island of Corfu, flying to Corfu.
- A walking and cycling holiday in New Zealand, flying to Auckland.

**Can you think of any other way to travel which might be better for the environment?**
